Using the Crystal Violet Biofilm Assay to Assess Efficacy of Traditional Family Remedies of Students

Jill Callahan
Saint Peter's University, Biology Department, 2641 Kennedy Blvd., Jersey City NJ 07306 USA
(jcallahan@saintpeters.edu)

The majority of bacterial infections are not caused by free-living species, but rather surface-associated biofilms. Within such infections, levels of antibiotic resistance are rapidly on the rise, thus increasing the need to explore alternative remedies. This project examined how the Standard Crystal Violet Biofilm Assay can be used to assess the anti-biofilm properties of treatment agents tested. Such remedies we have examined have been selected by students based on their cultural backgrounds and have included miswak chew sticks, soursop extract, propolis, coconut oil, and green tea. Allowing students to combine their own treatments based on family traditions with antibiotic alternative research has served as an invaluable method of student engagement. Ways this protocol can be adapted to a variety of biofilm species, treatment, and budgets were discussed.

Mission, Review Process & Disclaimer

The Association for Biology Laboratory Education (ABLE) was founded in 1979 to promote information exchange among university and college educators actively concerned with teaching biology in a laboratory setting. The focus of ABLE is to improve the undergraduate biology laboratory experience by promoting the development and dissemination of interesting, innovative, and reliable laboratory exercises. For more information about ABLE, please visit http://www.ableweb.org/.

Papers published in Tested Studies for Laboratory Teaching: Peer-Reviewed Proceedings of the Conference of the Association for Biology Laboratory Education are evaluated and selected by a committee prior to presentation at the conference, peer-reviewed by participants at the conference, and edited by members of the ABLE Editorial Board.
